PANCYTOPENIA - A STUDY OF 58 CASES
Rajesh Para¹, Shailaja Para²

HOW TO CITE THIS ARTICLE:

BACKGROUND: Pancytopenia means decrease in all three cell lines. It is the striking feature of many illness ranging from megaloblastic anaemia to leukemias. The underlying pathology of pancytopenia will determine the management and prognosis. OBJECTIVE: To identify the various causes of Pancytopenia. MATERIALS AND METHODS: The present study was undertaken at A Private Lab. RESULTS: 58 cases were studied, 30 males and 28 females with age ranging from 3 yrs to 90 yrs. Most of the cases presented with generalized weakness, followed by pallor, hepatosplenomegaly and bleeding manifestations. CONCLUSION: The present study was helpful in understanding the various causes of diseases process with bone marrow aspiration done in few of the pancytopenic patients along with support of biochemical investigations which were helpful in planning further investigations and management. KEYWORDS: Pancytopenia, bone marrow aspiration, megaloblastic anaemia, leukaemia.

INTRODUCTION: Pancytopenia is an important clinico-hematological entity encountered in our day to day clinical practice. It is a disorder in which all three major formed elements of blood (red blood cells, white blood cells and platelets) are decreased in number. (1) It is not a disease entity but a triad of findings that may result from a number of disease processes – primarily or secondarily involving the bone marrow. (2) There are varying trends in its clinical pattern, treatment modalities and outcome. (3) The severity of pancytopenia and underlying pathology determine the management and prognosis of the patients. (4) In present study we have evaluated the various causes of pancytopenia with peripheral blood, bone marrow findings along with Vit B12 and Lactate Dehydrogenase levels (LDH).

MATERIALS AND METHODS: 58 patients of pancytopenia patients were evaluated with bone marrow aspiration in Private lab. Patients from all age groups from both sexes were included. Inclusion criteria was hemoglobin < 10 g/dl, total leukocyte count (TLC) < 4000 /µl, platelet count < 100,000/ µl. (5) Patients blood was collected in EDTA (ethylenediamine tetra-acetic acid) and processed through Sysmex automated hematology analyzer. Peripheral smear was stained with Giemsa stain for all cases and examined thoroughly. Bone marrow aspiration was done in 15 patients after taking written consent and VitB12 and LDH levels in 20 cases.

RESULTS: A total of 58 patients who presented with pancytopenia were studied. They consisted of 30 males and 28 females with male to female ratio of 1:1. The age of patients ranged from 3yrs to 90yrs.
The commonest mode of presentation was generalized weakness followed by pallor. Hepatosplenomegaly was seen in subleukaemic leukemia of myeloid type.

Megaloblastic anaemia was seen as main cause of pancytopenia in 32 cases (46.6%). The peripheral blood picture showed macrocytes, macro ovalocytes, hyper segmented neutrophils, and bone marrow showed erythroid hyperplasia, megaloblastic type (Fig 1). In our study we saw in 20 cases of megaloblastic anaemia, LDH (lactate dehydrogenase) was raised and Vit B12 was reduced. In all cases of megaloblastic anaemia patients improved with vit B12 and folic acid therapy.

Malaria was observed in 5 cases (8.6%) presenting with pancytopenia, it was P. falciparum species.

We also came across 5 cases (8.6%) of Dengue who presented with pancytopenia in our study.

Sub leukaemic leukemia was seen in 2 cases (3.4%), out of which after bone marrow aspiration we came to a conclusion of acute myelocytic leukaemia in 2 cases (3.4%) (Fig 2).

Iron deficiency anaemia seen in 3 cases (5.2%) having microcytic hypochromic anaemia along with tear drop cells in peripheral smear and showed micronormoblastic hyperplasia in bone marrow aspirations.
Idiopathic thrombocytopenic purpura seen in 1 case (1.7%) and bone marrow showed increased megakaryocytes with hypolobulated and hypogranular appearance.

HIV was the cause of pancytopenia in 10 cases (17.2%). Bone marrow aspiration was not done in these patients.

Aplastic anaemia was seen in 5 cases (8.6%).

DISCUSSION: A total of 58 cases were studied. We did a detailed study of patients of Pancytopenia. Peripheral smear in 58 cases, bone marrow aspirations for 15 cases and LDH and Vit B12 for 20 cases were done. Age, gender-wise incidence, presenting complaints were studied and compared with other studies.

The age of patients ranged from 3 yrs to 90 yrs. Male to female ratio was 1:1. Age and sex distribution were studied and we compared it with study of other authors in Table 3.

Table 3: Age, sex distribution in various studies

The commonest cause of pancytopenia in our study is megaloblastic anaemia. Most of studies we compared such as in Khunger JM et al, Tilak V et al and Khodke K et al, had same findings.

Incidence of megaloblastic anaemia was 46.6 % in our study as compared to 72% reported in Khunger JM et al, 22. % in Kumar R et al, 68% in Tilak V et al, 44% in Khodke K et al, 12. 3% in S Pudasaini et al, 27.7% in Soma Yadav et al and 18% in Phurailatpan Madhubala Devi et al study. In our study we saw in 20 cases of megaloblastic anaemia, LDH (lactate dehydrogenase ) was raised. All cases of megaloblastic anaemia patients improved with vit B 12 and folic acid therapy. In Eivazi-Ziaei J et al study also observed increased LDH in megaloblastic anaemia. The expected increased LDH activity is the result of an accelerated turnover of bone marrow cells implying the release of this enzyme from dividing and/or decaying cells. In 20 cases Vit B12 also reduced.

Our study had 5 cases (8.6%) of malaria, as compared to 1% in Khunger JM et al, 3% in Kumar R et al and 3.9% in Tilak V et al.

We have observed 2 cases (3.4%) of acute myeloid leukemia. This diagnosis was based on bone marrow aspiration. Khodke et al reported a single case of AML –M2 out of 50 cases of pancytopenia. Kumar R et al reported 5 cases of ALL, 13 cases of of AML, 2 cases of hairy cell leukemia out 166 cases of pancytopenia over a 6 year study. S Pudasaini et al reported 10.5% AML and 1.8% of AML. Phurailatpan Madhubala Devi et al saw 14% of acute leukaemia and Soma Yadav et al had 13.3% of acute leukemia cases. The patho physiology of pancytopenia in...
Acute leukemia is unclear but is probably related to a combination of suppression of normal hematopoiesis and replacement of bone marrow by leukemic cells resulting in pancytopenia and immunosuppression. (9)

3(5.2%) cases of iron deficiency anemia were reported in our study who presented with pancytopenia. Phurailatpam Madubala Devi et al study (10) also 8% and S Pudasaini et al study (8) had 7% who presented with pancytopenia as a cause of iron deficiency disease.

Incidence of aplastic anemia in present study was 5 cases (8.6%) and it was 4% in Khodke et al and Khugner et al (6, 7) but it was more that is 29.5% in Kumar et al study (5) and 38.3% in Soma Yadav et al (9) study.

HIV was one of the important cause of pancytopenia in our study having 10 cases (18%), it was 1.6% Soma Yadav et al (9) study in 2% in Khodke et al study (7) and 6% in Phurailatpam Madhubala Devi et al study (10). Virtually all patients with advanced AIDS have pancytopenia as a rule, the causes are production of the antibodies which might be triggered by exposure of crypt antigens as a consequence of infection related damage of blood cells especially platelets and granulocytes. The hematopoietic cells especially platelets and granulocytes are antigenically similar to agents like HIV and other microorganisms infecting the patients. These antibodies could interact with tissue antigens. Third possibility is that HIV act as direct inducer of autoimmunity. (9)

Present study revealed 1 case (1.7%) having Idiopathic Thrombocytopenic Purpura as compared to 10.5% observed in S Pudasaini et al study (8).

CONCLUSION: In our study we have encountered, other than common reasons like megaloblastic anemia, HIV infection etc. presenting as pancytopenia, even, iron deficiency anemia, subleukemic leukemia, Dengue and Malaria also also had presented with pancytopenia. Bone marrow aspiration supported with biochemical profile is very important for confirmation of cause of pancytopenia. Proper diagnostic work up is essential before use of hematincs and blood transfusion in all patients presenting as pancytopenia.
