PRESENTATION OF CASE

Here, we describe 2 cases of atypical presentations of Osteoarticular Tuberculosis.

**Case I**

We describe a 12-year-old girl with right hand dominance, who came with complaints of pain and swelling over Lt. forearm for 4 months. Swelling was initially small, gradually progressive; Pain was present only on hard work. There was no other specific positive history.

On examination there was diffuse swelling over the Lt. forearm, mild tenderness, no warmth, more on radial side, no scars/sinuses. The Range of Motion was full (Elbow and Wrist).

**X-Ray Lt. Forearm (AP and Lateral Views)**

Osteolytic lesion in Diaphysis and metaphysis.

**Clinical Picture- Minimal Swelling with Ill-Defined Borders**

**MRI Imaging**

Soft tissue involvement
Lesion

Financial or Other, Competing Interest: None.
Submission 03-07-2017, Peer Review 28-07-2017,
Acceptance 02-08-2017, Published 07-08-2017.

DOI: 10.14260/jemds/2017/1000
Other Investigations Done Were
- TC, DC.
- ESR: 30 mm/hr.; CRP negative.
- CXR: Normal.
- Mantoux Test: Negative.

The patient was initially thought to be having a subacute osteomyelitis or a benign tumour. It was proceeded with Open Biopsy.

Case II
We describe a 54-year-old female with right hand dominance, came with complaints of pain and swelling over the Lt. knee for the past 6 months. It was gradually progressive, inc. on hard work and squatting. No h/o fever, chronic cough, LOW, LOA, evening rise in temp., night cries, night sweats or TB contact.

On examination there was swelling and tenderness over the Lt. knee, more on medial aspect. Synovial thickening was present. There was no warmth/ scars/ sinus/ patellar tap/ crepitus/ deformity.

Range of Motion was full, but minimal pain on extremes of motion.

X-Ray Left Knee Joint (AP and Lateral Views)

Patient was a known case of Type II Diabetes Mellitus, on treatment. Clinically and Radiographically Neuropathic or an Osteoarthritic Joint.

Other Investigations Were Done
- TC, DC- Normal; Blood Sugar Elevated.
- ESR- 30 mm/hr.; CRP: Negative.
- CXR- Normal.

- Synovial fluid Analysis- Proteins increased; Sugar reduced.
- Mantoux- Negative.

Finally, the patient was planned for Synovial Biopsy.

DIFFERENTIAL DIAGNOSIS
For Case 1
- Subacute Osteomyelitis.
- Benign Tumour.

For Case 2
- Charcot Joint.
- Rheumatoid Arthritis.
- Osteoarthritis.
- Low Grade Septic Arthritis.

CLINICAL DIAGNOSIS
For Case 1
- Subacute Osteomyelitis.

For Case 2
- Charcot Joint.

PATHOLOGICAL DISCUSSION
Introduction and History of Tuberculosis
TB was known to humans even 5,000 years ago. In India, it was described in Rigveda and Atharvaveda[1] (3500 - 1800 BC) – “Yakshma.” TB lesions have been described long ago in Egyptian Mummies.[2] Hippocrates described Pulmonary Tuberculosis in the year 400 BC.[3] The TB epidemic in Europe, also called as the “Great White Plague,” rooted in the beginning of the 17th century.[4]
Robert Koch discovered Mycobacterium tuberculosis, the causative agent in the year 1882.\[5\]

**INVESTIGATIONS**

- AFB Staining.
- HPE.
- Mantoux Test.
- Culture- LJ and BACTEC.
- ELLISPOT- IgM and IgG Antibodies.
- PCR.
- Interferon Assays- TB antigens ESAT-6 and CFP-10.
- ADA assay.
- Imaging Modalities.

**DRUGS IN MANAGEMENT**

1\textsuperscript{st} Line

- Isoniazid.
- Rifampicin.
- Pyrazinamide.
- Ethambutol.

2\textsuperscript{nd} Line

- Ethionamide.
- Kanamycin.
- Pas.
- Amikacin.
- Cycloserine.
- Ofloxacin.

**Atypical Presentations**

- Unusual Presentations: Persistent backache, referred pain to trunk, abdomen, present as spinal tumour syndrome, ankylosing.\[6\]
- Spondylitis.\[7\]
- Evidences of associated extraskeletal tuberculosis like cough, expectoration, lymphadenopathy, diarrhoea and abdominal distension may be seen.\[8\]

**DISCUSSION OF MANAGEMENT**

**Case I**

The patient was initially thought to be having a subacute osteomyelitis or a benign tumour. It was proceeded with Open Biopsy.

**Surgical Procedure**

Open Biopsy and Curettage was done for this patient. Per-operatively, the cavity was filled with pus and caseous material.

The various investigations that were done after the procedure-

- Pus Culture and Sensitivity- no growth.
- HPE (Granulation Tissue)- Tuberculous Granuloma.
- Cat-I ATT was started.

**Per-Op Pictures**

**Followup Evaluation**

The patient was followed at 3 months and at 6 months. At 3 months followup, the pt. was on ATT and the followup radiograph showed healing lesion and clinically the child had no specific complaints with full range of motion at the adjacent joints.
At 6 months followup, the lesion completely healed. Radiologically, the patient finished the whole course of ATT. Clinically, there was no recurrence of swelling or pain. The child had full range of motion of adjacent joints.

**Followup Evaluation**
The patient was followed up clinically and radiologically at 3 months and at 6 months. At 3 months followup, the pt. was on ATT and the followup radiograph showed healing lesion and clinically the patient had no specific complaints with full range of motion at the knee joint and adjacent joints as well.

**Case II**
**Case 2**
Synovial Biopsy was suggestive of Tuberculous Granuloma.
- Patient was registered and was started on Category I Anti-Tubercular Therapy.

At 6 months followup, the lesion completely healed. Radiologically, the patient finished the whole course of ATT. Clinically, there was no recurrence of swelling or pain. The patient had full range of motion of knee joint as well as adjacent joints.
Both the patients included in the above study presented with atypical symptoms suggesting diagnosis other than Tuberculosis; later were biopsy proven Tuberculosis; were treated with Anti-Tubercular Therapy.\(^9\)\(^{10}\) Both patients showed complete healing of the lesion at 6th month followup after completing ATT course with full preservation of joint movements.\(^{11}\)

- Incidence of Pulmonary TB has grossly reduced over the years.\(^{12}\)
- Atypical presentations are not uncommon.\(^{13}\)
- Due to MDR/XDR TB, emergence especially of skeletal TB with atypical presentations is on rise.\(^{14}\)
- Diagnosis is difficult and detected only in late stages.\(^{15}\)
**REFERENCES**

**CONCLUSION**

- Early diagnosis is essential to prevent long-term disability. (Availability of Potent Drugs).

- Combined clinical approach and investigations aid in early and accurate diagnosis.

- Anti-Tubercular Therapy is the treatment of choice with surgical intervention needed only in some cases.
